Q 1. If you were able to affect the operation of the Defence Template, document how you did this and highlight the mistakes that you believe the target made to allow your attack to occur. Otherwise, simply acknowledge that your attack failed.

Answer:

Our attack failed.

Q 2. How secure do you believe the Bluebrick implementation is?

Answer:

Bluebrick implementation of beta environment is very secure. The inter process communication is heavily guarded with reference membrane and context reduction engine. And firewall allows only a single open port.

Q 3. Given that Bluebrick java code was carefully analysed to ensure that no implementation flaws existed within the connection protocol to other peer Nodes, how secure do you think it would be on the internet?

Answer:

It would be secure if implemented on both end. Our primary objective of reliability might be fulfilled but we doubt its performance i.e. slow communication over the internet.
